

USER INTERFACE AND DESIGN

Experiment – 3(b)

Design a Wireflow Diagram for an E-Commerce Mobile Application. Evaluate the user flow through Login, Product Search, Cart, Checkout and Rating.

Wireflow Diagram

AIM:

The aim is to create a wireflow diagram for a shopping app that shows the full user journey — from logging in, searching for products, adding to cart, checking out, and then giving a rating.

PROCEDURE:

1. List all the screens in the user journey: Sign In, Sign Up, Loading, Home, Search, Search Results, Product List, Product Details, Cart, Cart Pop-Up, Checkout, PayPal, Checkout Complete, and Rate.
2. Sketch each screen with simple UI elements like buttons and input fields.
3. Connect the screens with arrows showing what action takes the user from one screen to the next.
4. Group them into three phases: Login, Search and Cart, and Checkout and Rating.

OVERVIEW:

A wireflow combines wireframes (screen layouts) with a flowchart (navigation arrows). Each screen shows its basic structure, and arrows between them show how users move from one to another. This is helpful for planning shopping apps where users go through many steps.

Group 1: Login Process

The login flow starts at the Sign In screen. New users can open a Sign Up popup without leaving the login page. After logging in, a loading screen appears before the Home screen loads. This keeps users informed and prevents confusion.

Fig 1: Login Process — Sign In → Sign Up → Loading → Home

Group 2: Search and Add to Cart

From the Home screen, users can search for products. The search leads to results, then a product list, and then a product detail page with "Add to Cart" and "Buy Now" buttons. Adding to cart shows a small popup to confirm the item was added, and then the user can view the full cart.

Fig 2: Search and Add to Cart — Home → Search → Results → Product → Cart

Group 3: Checkout and Rate

From the Cart, the user proceeds to Checkout where they enter delivery and payment details. Tapping pay takes them to a PayPal screen. After successful payment, a confirmation screen with a tick appears. Then the user can give a star rating and submit feedback.

Fig 3: Checkout → PayPal → Confirmation → Rate

Complete Wireflow Diagram

The full diagram below puts all three phases together into one end-to-end view of the user journey.

Fig 4: Complete Wireflow Diagram — Full User Journey

ANALYSIS:

- The wireflow clearly shows the complete user journey from start to finish.
- Popup overlays for Sign Up and Cart confirmation work well without breaking the flow.
- The three-phase structure matches how users naturally think about shopping.
- Familiar elements like the search bar and labeled buttons make each step intuitive.
- The rating screen at the end helps collect honest feedback right after a good experience.
