

USER INTERFACE AND DESIGN

Experiment – 4(a)

Conduct Task Analysis for an App (e.g., Online Shopping) and Document User Flows. Create Corresponding Wireframes using Lucidchart.

AIM:

The aim is to break down what a user does in a shopping app step by step, document those steps as user flows, and then draw flowcharts and wireframes in Lucidchart to show the full process visually.

PROCEDURE:

Step 1 — Identify the main tasks: Browsing Products, Searching for a Product, Adding to Cart, and Checking Out.

Step 2 — Write out the user flow for each task in simple steps.

Step 3 — Open Lucidchart and create a new document.

Step 4 — Add shapes for each step and connect them with arrows.

Step 5 — Use rectangles for steps, diamonds for decisions, and ovals for start/end.

Step 6 — Review and save the diagram.

USER FLOWS:

Browsing Products: Home Screen → Product Categories → Product List → Product Details

Searching for a Product: Search → Enter Query → Search Results → Product Details

Adding to Cart: View Products → Product Details → Add to Cart

Checking Out: Open Cart → Review Cart → Checkout → Shipping Info → Payment Info → Place Order

PART 1: FLOWCHARTS

The flowcharts below show the full user journey made in Lucidchart. Part 1 covers logging in, browsing, and adding to cart. Part 2 covers checkout and order confirmation.

Flowchart Part 1: Login, Browse and Add to Cart

The flow starts with opening the app. If the user is not logged in, they go to the Login screen. After logging in, they can browse or search for products, view product details, and add items to the cart.

Fig 1: Flowchart Part 1 — Start → Login Check → Home → Browse → Cart

Flowchart Part 2: Checkout and Order Confirmation

From the cart, the user proceeds to checkout by entering shipping and payment details. After placing the order, a confirmation screen appears and the flow ends.

Fig 2: Flowchart Part 2 — Cart → Checkout → Shipping → Payment → Order Confirmed → End

PART 2: WIREFRAME DIAGRAM

The wireframe shows four key screens in sequence — Home, Product Page, Cart, and Checkout — connected by arrows. Each screen is drawn as a simple box with a bold label to focus on structure rather than design.

Fig 3: Wireframe — Home Screen → Product Page → Cart → Checkout

ANALYSIS:

- The task analysis clearly identifies every action the user needs to take.
- The flowcharts show decision points like the login check, which is important for security.
- Splitting the flowchart into two parts makes it easier to read.
- The wireframe shows the four most important screens and how they connect.
- Together, the flowchart and wireframe give a complete picture of the user journey.
