

USER INTERFACE AND DESIGN

Experiment – 7(a)

Develop low-fidelity paper prototypes for a banking application and convert them into digital wireframes using Pencil Project.

AIM:

The aim is to first create hand-drawn paper sketches of a banking app (Login, Dashboard, and Transfer screens) and then convert them into proper digital wireframes using Pencil Project.

PROCEDURE:

Tool Used: Pencil Project — <https://pencil.evolus.vn/>

1. Sketch basic layouts on paper for the Login, Dashboard, and Transfer screens.
2. Review the sketches for clarity and improve if needed.
3. Open Pencil Project and create a new mobile project.
4. Add a page for each screen and place UI elements using the stencil library.
5. Connect the screens using navigation links.
6. Export the wireframes as PNG images.

OUTPUT – DIGITAL WIREFRAMES:

Figure 1: Login Screen

The login screen is the first thing the user sees. It shows the app name "Bank App" with the tagline "Secure.Simple.For You." and two input fields for username and password. A blue "Send" button logs the user in. There are also links for "Forgot Password?" and "Create new account" for convenience.

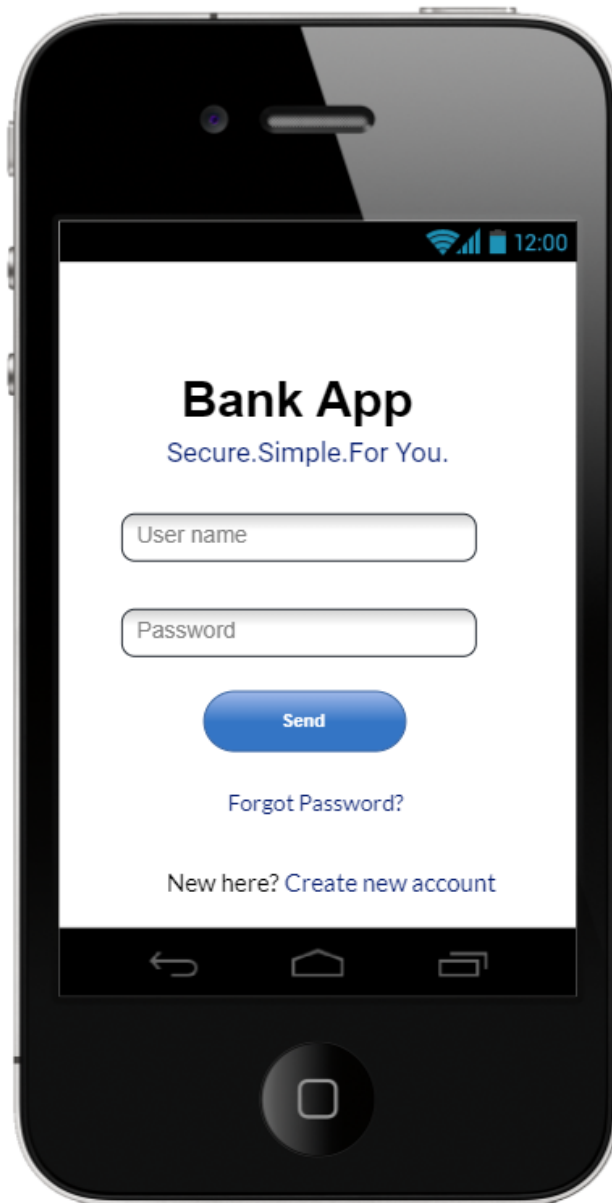

Figure 1: Login Screen — Banking Application Wireframe

Figure 2: Dashboard Screen

After logging in, the dashboard shows a welcome message and the user's total account balance. Below that, three quick action buttons — Transfer Money, View Transactions, and Pay Bills — let the user do the most common tasks with just one tap.

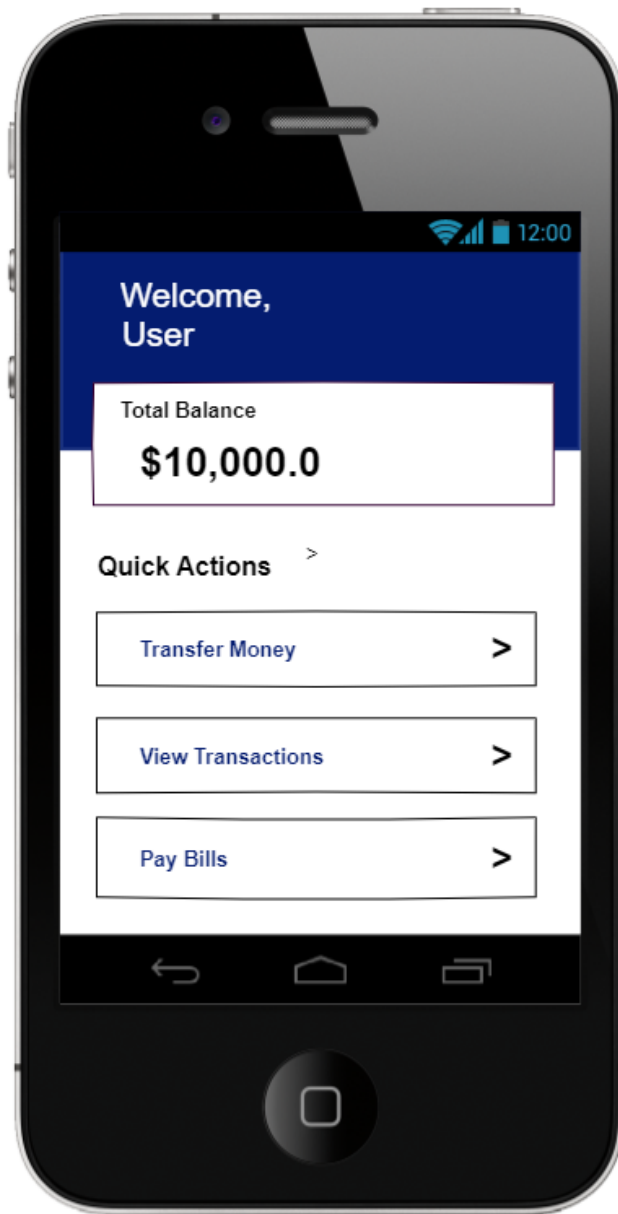

Figure 2: Dashboard Screen — Banking Application Wireframe

Figure 3: Transfer Screen

The transfer screen opens when the user taps "Transfer Money". It has two input fields — one for the account number and one for the amount — and a blue "Send" button. The screen is kept simple so the user can focus on entering the right details without distraction.

RESULT:

Paper prototypes were created first for all three screens and then converted into clean digital wireframes using Pencil Project. All three screens were exported as PNG images.

CONCLUSION:

Starting with paper sketches and then moving to digital wireframes is a great way to design interfaces. Paper sketches are quick and easy to change, while Pencil Project adds precision and proper UI elements. Each screen focuses on one task, making the banking app simple and easy to use.
